# WILL OUR BEEF & DAIRY BE SAFE TO CONSUME?

## BOVAER® 10 IS BEING ADDED TO CATTLE FEED

Bovaer® 10 is an additive for cattle feed intended to limit cows from producing methane. This is being rolled out globally. Have you informed yourself about this new drug?

### What do the studies say?

#### The product is suspected of causing infertility

This is stated on page two of the Safety Data Sheet. At certain doses it shrunk the ovaries of cows and reduced the sperm count and sperm mobility of rats.

#### They don't know if it causes cancer

The safety data sheet states that it is unknown whether this drug can cause cancer, mutate DNA, or disrupt hormones, and there is no available information on chronic health effects.

### No rigorous safety studies

The FDA acknowledges that Bovaer® 10 is a drug; however, the agency chose to classify it as a supplement, which doesn't require the more rigorous animal drug approval process, like extensive regulatory oversight, longer review periods, and thorough safety and efficacy testing.

### Are cows really a threat?

Traditional research in beef production considers only emissions. However, data from a recent three-year study found that soil and forage carbon capture was greater than all emissions from beef production in a pasture-based system.
